

## **Amendments to the Specification:**

Please amend the specification at by replacing the paragraph at page 6, lines 1-12, with the following paragraph:

--Typically one or more “pragmatic labels” or “label face stocks,” are cut into an imaged or unimaged “pragmatic pre-label sheet” that is adhesively attached to a carrier sheet, both pragmatic pre-label sheet and carrier sheet forming an “integral-separable pre-label receiver sheet” or “pre-label receiver sheet.” The one or more pragmatic labels cut in the pre-label receiver sheet (typically only the pragmatic pre-label sheet), which labels can be cut into various shapes, ~~form~~ from what is then referred to as a “pragmatic-label sheet,” the bottom surface of which, like the pre-label receiver sheet before it, remains adhesively attached to the top surface of a common carrier-sheet or to the top surface of a separate carrier sheet, as the case may be, depending on the cutting operation. Each pragmatic label in a pragmatic-label sheet can be separated from the carrier sheet before applying it to decorate or otherwise label an object.
